

PreCut

Mac app for video editors. Footage in, organized Premiere project out.

Beta · Version 1.0.0-beta.2

PreCut sits between your footage and Premiere. Drop folders of video and audio in. PreCut transcribes interviews, tags B-roll for visual search, syncs lavs and booms to camera audio, and exports a single Premiere XML containing every selected timeline plus a searchable, organized B-roll library. There's also an optional AI producer that can pitch cut ideas based on what's in your transcripts — but the indexing, syncing, and organized export are the core value, AI or not.

WHAT IT DOES

Auto-sync audio

Lavs and booms aligned to camera audio.
Cross-validates across clips for tricky multi-mic shoots.

Searchable B-roll library

Every clip auto-tagged by content, motion, and camera type. Find with Cmd-F in Premiere.

Local transcription

Whisper-based, runs on your Mac. Word-level timecodes for every interview clip.

Organized Premiere export

One XML. Standard bins, tagged B-roll library, plus an all-synced A-roll reference.

Default Includes

Stock SFX, logos, music libraries set up once — added to every export from then on.

Platform-aware presets

Reels, TikTok, Shorts, Facebook, X. Each sets aspect, fps, and safe-zone overlay.

AI producer (optional)

Bring your own Anthropic API key. Pitches concepts or builds full cuts from a brief.

Footage-only mode

One click to skip the AI and get a clean Premiere project skeleton with synced footage.

HOW TO USE IT

1

Drop in footage

Drag folders of video and audio into a new project. PreCut watches and picks up new files automatically.

2

Wait for indexing

Transcription, B-roll tagging, and audio sync run in the background. Progress streams in the activity log.

3

Export to Premiere

Pick a save location, hit Export. You get one XML with everything organized, synced, and ready to edit.

4

(Optional) AI producer

Set an Anthropic API key and ask for cut ideas. Or skip this step — the rest of the app works without it.

FOR BETA TESTERS

This is a beta. The core workflow is feature-complete and tested on real projects, but parts are still being iterated.

What's most useful to test:

- Audio sync on multi-mic shoots, especially long sessions where mics rolled before/after camera
- Importing the exported XML into your real Premiere version
- Default Includes with your actual stock libraries
- Anything that feels confusing, slow, or wrong

Send feedback to info.prep2post@gmail.com — screenshots + a short description of what you were doing are most useful. Reproduction steps if the issue is a bug.

INSTALL

Requires: Apple Silicon Mac (M1+), Premiere Pro (any recent version) for opening exports.

Optional: Anthropic API key for the AI producer. All other features work without one.

To install:

- Unzip the download
- Right-click the app → **Open** (one-time Gatekeeper prompt)
- First launch installs missing dependencies (ffmpeg, Python). Streamed progress, no terminal needed.
- The Install Guide PDF inside the zip has details if anything goes wrong.
