

Install PreCut

Version 0.45.5 · Apple Silicon Macs · macOS 12 or later

Heads up: PreCut isn't notarized with Apple yet, so macOS will show a security dialog the first time you open it. This is expected — the steps below walk you through a one-time bypass in System Settings. PreCut is safe and runs entirely on your Mac with no telemetry.

FIRST, INSTALL THE APP

1. Double-click the downloaded zip

Finder will extract a folder containing **PreCut.app** and this PDF. You can delete the zip afterward if you want.

2. Drag PreCut.app into your Applications folder

Open a new Finder window, click **Applications** in the sidebar, and drag **PreCut.app** into it. This is where macOS expects installed apps to live.

3. Double-click PreCut to open it

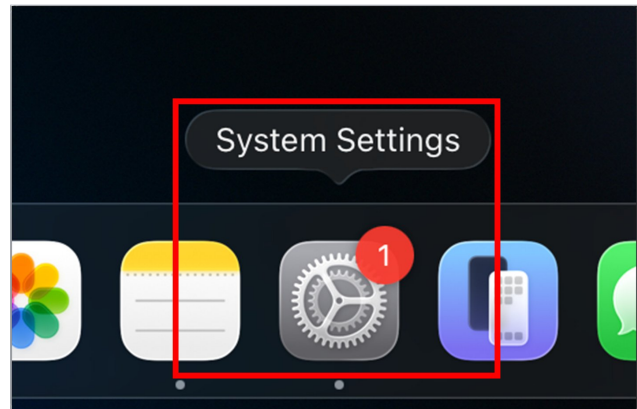

A dialog will appear saying “**PreCut**” **Not Opened**. Click **Done**. Don't click “Move to Trash” — the next three steps will unblock it permanently.

Turn the page → to finish unblocking PreCut.

THEN, UNBLOCK IT IN SYSTEM SETTINGS

4. Open System Settings

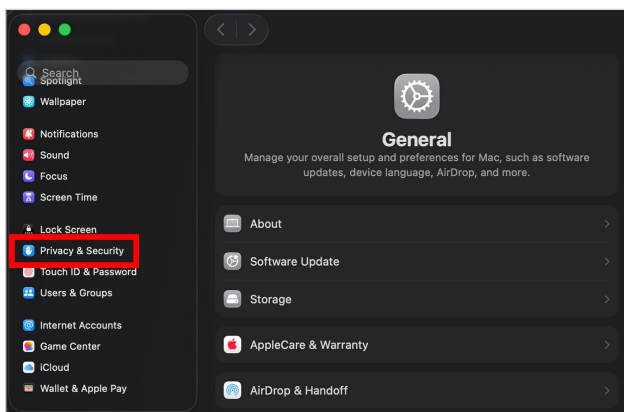

Click the gear icon in your Dock, or press **Cmd+Space** and type “System Settings” to search for it.

System Settings in the Dock.

5. Click Privacy & Security in the sidebar

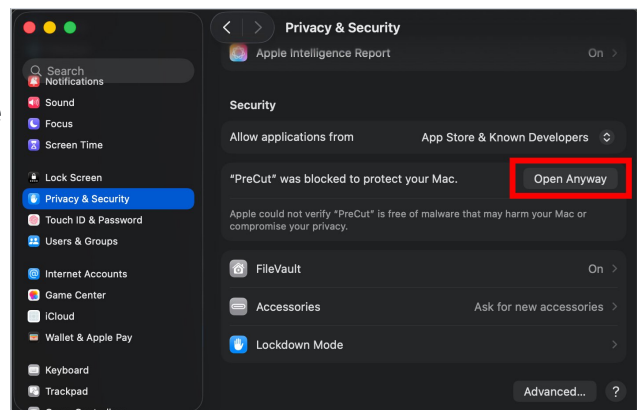

It's about halfway down the left sidebar, next to a blue hand icon. You may need to scroll the sidebar to find it.

Privacy & Security in the sidebar.

6. Scroll down and click Open Anyway

Scroll the right-hand panel all the way to the bottom. Under the **Security** heading you'll see “PreCut was blocked to protect your Mac” with an **Open Anyway** button. Click it, enter your password or Touch ID, and click **Open** on the final confirmation dialog.

The Open Anyway button.

That's it. PreCut will launch and show a first-time setup screen that installs ffmpeg and a few Python tools (5–10 minutes). From now on, you can open PreCut by double-clicking it like any other app — you won't need to visit System Settings again.
